```
-!- SUBCELLUAR LOCATION: Extracellular matrix.
-!- SUBCELLUAR LOCATION: Extracellular matrix.
-!- TISSUE SPECIFICITY: Wide tissue distribution; high presence in dense connective tissue in skeletal muscle.
-!- PTM: Lysines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in all cases and bind carbohydrates.
-!- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
-!- PTM: May contain numerous cysteine residues involved in inter- and intramolecular disulfide bonding.
-!- SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.
-!- SIMILARITY: Contains 8 fibronectin type-III domains.
-!- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.
-!- SIMILARITY: Contains 2 VWFA domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     collagen XIV by CD and NMR.",
Blockemistry 38:6479-6488(199).
-i- FUNCTION: An adhesive role by integrating collagen bundles. It is probably associated with the surface of interstitial collagen fibrils via COL1. The COL2 domain may then serve as a rigid arm which sticks out from the fibril and protrudes the large N-terminal globular domain into the extracellular space, where it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE=99280705; PubMed=10350466; DOI=10.1021/bi9900222; Montserret R., Aubert-Foucher E., McLeish M.J., Hill J.M., Jaquinod M., van der Rest M., Deleage G., Penin F.; "Structural analysis of the heparin-binding site of the NC:
